

## Deleting Vertices and Relations in the Posets Julia Package

### Deleting Vertices

Deleting vertices from a poset is somewhat different from deleting vertices in a graph. When a vertex is deleted from a graph, the vertex and all edges incident with that vertex are removed. Similarly, when a vertex is removed from a poset, the relations between all the remaining vertices remain unchanged. However, this is not the same as simply deleting a vertex and its edges from the poset's Hasse diagram.

Consider the poset on the left in Figure 1. Mathematically, deleting vertex 2 from this poset results in the poset in the middle of the figure. In the Hasse diagram we have an edge from 1 upward to 3 because  $1 < 3$  in the original poset, and so we still have  $1 < 3$  after the deletion. Similarly, the relation  $4 < 3$  is preserved.

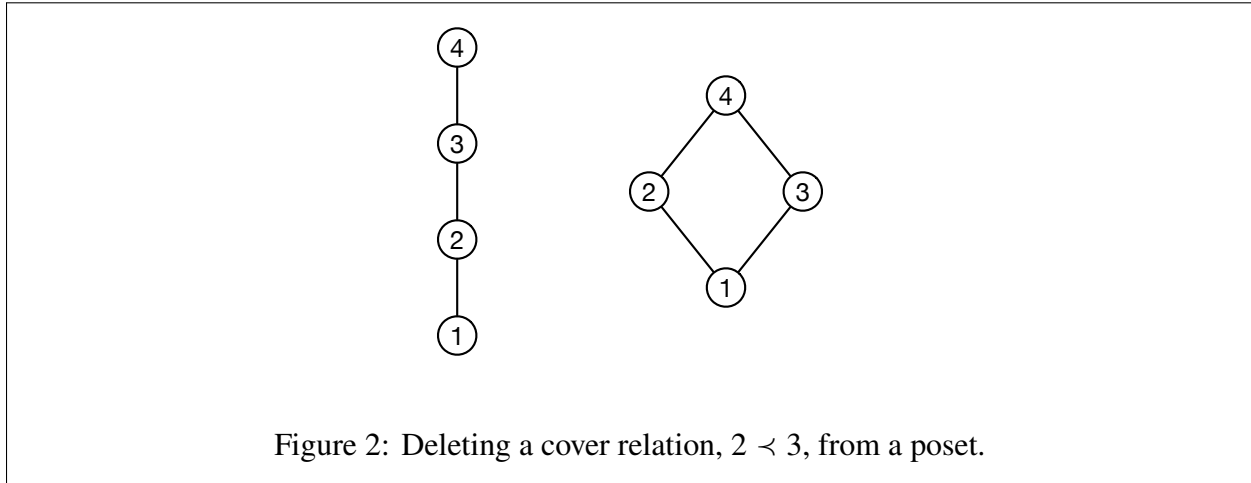

However, the Julia Posets package is based on the Graphs package. A key convention of graphs (and hence of posets) in these packages is that the vertex set is always of the form  $\{1, 2, \dots, n\}$ . If vertex  $n$  is deleted, no special action needs to be taken. But if a vertex  $k$  (with  $k < n$ ) is removed, then the name  $n$  is no longer valid by the naming convention. In this case, the vertex formally named  $n$  is renamed  $k$  (the label of the deleted vertex). As a result, the result in Posets of deleting vertex 2 in Figure 1 is the poset on the right.

This is illustrated in Julia as follows:

```
julia> p = chain(3) + chain(3);
julia> add_relation!(p, 4, 2);
julia> rem_vertex!(p, 2);
julia> collect(relations(p))
5-element Vector{Relation{Int64}}:
 Relation 1 < 3
 Relation 4 < 2
 Relation 4 < 3
 Relation 4 < 5
 Relation 5 < 2
```

## Deleting Relations

Deleting a relation from a poset is complicated. The simplest case is the removal of a relation  $a \prec b$  where  $b$  is a cover of  $a$ . In this case, it is possible just to remove the single relation  $a \prec b$  and make no other changes to the poset. This is illustrated in Figure 2 in which we delete the cover relation  $2 \prec 3$  from the linear order  $1 \prec 2 \prec 3 \prec 4$ .

The following Julia code implements the action of deleting  $2 \prec 3$  from a 4-element chain:

```
julia> p = chain(4);
julia> rem_relation!(p, 2, 3);
julia> collect(relations(p))
6-element Vector{Relation{Int64}}:
Relation 1 < 2
Relation 1 < 3
Relation 1 < 4
Relation 2 < 3
Relation 2 < 4
Relation 3 < 4
```

It is an easy exercise that deleting a single cover relation from a poset yields a poset.

The situation is different for non-cover relations. For example, consider the linear order  $1 \prec 2 \prec 3 \prec 4 \prec 5$ . Suppose we wish to delete the relation  $2 \prec 4$ . If we only delete that one relation, we would still have  $2 \prec 3$  and  $3 \prec 4$ , so omitting  $2 \prec 4$  would result in a violation of transitivity.

More generally, suppose we wish to remove the relation  $a \prec b$  from a poset. If there is an element  $x$  with  $a \prec x \prec b$  we cannot delete just  $a \prec b$  and keep both  $a \prec x$  and  $x \prec b$ . There is no *a priori* reason to prefer one of  $a \prec x$  or  $x \prec b$  for deletion (or retention). Hence, it is a design decision that when removing a relation  $a \prec b$  we also remove both relations  $a \prec x$  and  $x \prec b$  for all  $x$  between  $a$  and  $b$ . Again, one can prove that the result of this is a poset.

For example, suppose we wish to delete the relation  $2 \prec 4$  from the linear order  $1 \prec 2 \prec 3 \prec 4 \prec 5$ . Our implementation deletes not only  $2 \prec 4$  but also  $2 \prec 3$  and  $3 \prec 4$  as well. This is illustrated in Figure 3.

Figure 3: Deleting the non-cover relation  $2 < 4$  from the poset on the left yields the poset on the right. The function `rem_relation!(p, a, b)` not only deletes  $a < b$ , but also all relations of the form  $a < x$  and  $x < b$  for vertices  $x$  between  $a$  and  $b$ .

This Julia code illustrates the deletion:

```
julia> p = chain(5);
julia> rem_relation!(p, 2, 4);
julia> collect(relations(p))
7-element Vector{Relation{Int64}}:
Relation 1 < 2
Relation 1 < 3
Relation 1 < 4
Relation 1 < 5
Relation 2 < 5
Relation 3 < 5
Relation 4 < 5
```
